

Zero-touch / Enrollment

Zero-touch enrollment is a deployment method that allows organizations to automatically configure and manage corporate devices right out of the box.

When a user powers on a new device and connects to the internet, it automatically downloads enterprise policies, apps, and security settings with no manual IT setup required.

Enrolling devices with Zero-touch

First, create an enrollment token in KMM

The screenshot shows a mobile application interface for creating an enrollment token. At the top left is a back arrow and the text 'Back'. The title is 'Create Enrollment Token'. Below the title are three columns of form fields. The first column has 'Display Name' with the value 'Testing Demo' and 'Additional Data' which is empty. The second column has 'Duration' set to 'Forever' and a toggle for 'One Time Only' which is turned 'No'. The third column has 'Device Group' set to 'granitti_demo' and 'Management' set to 'PersonalUsageDisallowed'. A green 'Save' button is at the bottom left.

Then you need to either have access to Zero-touch customer portal, or give the token to someone who has access to it.

Kuori usually manages zero touch portal and handles the initial device enrollment through it.

Zero-touch customer portal

Add Configuration: Go to the **Configurations** tab.

- **Set the EMM DPC:** Select your MDM application/agent (or `Android Device Policy`) as the EMM DPC.
 - **Add DPC Extras:** Paste the JSON or setup token generated from your EMM dashboard into the DPC Extras box.
 - **Assign:** Save the configuration and either set it as your **Default** profile or manually apply it to specific devices using their serial number in the **Devices** tab
-
