

2.6.1

What's new in DSM?

This release makes device failures easier to understand and fixes issues with signing in and deleting users.

Signing in

Try another account after a refused sign-in. A refused sign-in no longer leaves you stuck retrying with the same account. DSM ends the Kuori sign-in session before showing the error. The next sign-in asks for your credentials again, so you can use a different account.

Groups

Open a group from a device. Group names on a device's Groups tab are now links. Select a name to open that group's dashboard.

Devices

Failure descriptions. The Device failures table on a device's Logs tab now shows a Description alongside the Failure Code and Time. The Sensor column has been removed.

More failure codes explained. Descriptions now cover humidity sensor failures and memory and initialization errors. Failure code 1000 is now labelled "Unknown Error". Codes DSM does not recognize show "Unknown failure code".

Alerts

Failure descriptions in emails. Failure alert emails now include a description next to each code, such as "111 (Temperature sensor 1 inoperable)". The descriptions match those shown in DSM.
