

APK Restriction Structure

Troubleshooting APK restriction structures

A warning triangle is shown on a package or setting

The structure has unfinished settings. The warning lists them, for example *Property 'pick_one' of type 'Choice' should have selectable values defined*. Fill in the **Selectable entries** of the named settings and save.

The app is not in the list

Only uploaded APK apps whose APK declares restrictions appear here. Google Play apps are never listed — their settings come from Google Play. If an uploaded app is missing, the APK does not declare any restrictions; that must be fixed in the app itself.

The app ignores the configured values

The delivered values do not match what the app expects. Check that each **Selectable entries** value, the **Type** and the **Key** are exactly what the app's documentation states.

A new app version's settings do not appear

The structure is read only when the app is first uploaded. To read it fresh, delete the app from the Application List and upload the new APK — this loses the hand-filled entries, so note them down first.

The warnings did not disappear after saving

Every **Choice** and **MultiSelect** setting must have at least one selectable entry. Check for unfinished settings with the **Show Unfinished** switch.
